

PRD — NIFTY Swing Trade Journal

📅 Date	February 10, 2026
≡ Domain	FinTech / Personal Analytics
⋮ Lead For	FinTech consumer analytic
⚡ Project Rating	★★★★★
⚙ Status	In progress
≡ Summary	Built from my personal experience as an active NIFTY 50 swing trader using RSI divergence, Fibonacci retracement, ADX, and Bollinger Bands. The 40-point exit trade referenced in the problem statement is a real trade from early 2026. The emotional bias risk row and the hybrid structured/free-form design decision both come from genuine trading psychology I have experienced. Lead document for FinTech, consumer analytics, and personal productivity roles.

NIFTY 50 Swing Trade Journal

PRODUCT REQUIREMENTS DOCUMENT (PRD)

Product Name: NIFTY Swing Journal

Document Version: 1.0

Author: Harsh Raj

Date: June 2026

1. Problem Statement

Most retail traders in India know they should maintain a trade journal, but very few actually do it consistently. After every NIFTY trade, people either skip journaling completely or make rough notes in Excel or the Notes app that they never review properly. The existing tools feel too complicated or too generic for Indian swing traders.

The real problem is emotional. After closing a trade, I sit and analyse the chart — what went right and what went wrong. If I made a loss, I keep thinking, "Why didn't I exit earlier?" If I made a profit, I regret, "Why didn't I hold longer?" There was a trade in early 2026 where I entered a NIFTY position based on RSI divergence on the 15-minute chart, exited when it moved 40 points in my favour, and then watched it run another 120 points without me. I had no record of why I exited when I did, so I could not learn anything systematic from it.

This matters because trading success is not mainly about technical or fundamental knowledge — it is about discipline and emotional stability. Without a proper journal built for Indian market realities (F&O expiry, NIFTY-specific setups), traders stay stuck in the same patterns, lose money repeatedly, and never improve systematically.

2. Goals and Outcomes

Metric	Baseline	Target	Rationale
Time to log a completed trade	15–20 minutes	Under 3 minutes	Reduce friction
Pattern identification time	Hours of manual review	Instant filtering	Enable quick learning
Win rate visibility	Vague estimates	Exact per setup	Data-driven decisions

3. Target Personas

Persona 1: Harsh – Active Swing Trader

I actively trade NIFTY 50 using RSI divergence, Fibonacci retracement, ADX, and Bollinger Bands. After every trade I analyze the chart but only keep rough notes. I frequently second-guess my exits and entries because I don't have a structured record of my thinking and emotions at the time.

Persona 2: Priya – Part-Time Trader

34-year-old software engineer who trades 2–3 times a week. Has read multiple books on technical analysis but has never tracked her performance systematically. **Her biggest frustration is not knowing whether her Bollinger Band squeeze entries perform better in trending markets or ranging ones, because she has never recorded the market condition at the time of entry.**

4. User Stories

- As a swing trader, I want to quickly log a trade with setup tags and automatic calculations, so logging doesn't feel like a chore.
 - As a trader, I want to filter all trades by setup and see win rate and average R:R, so I can improve my strategy.
 - As a trader, I want to attach chart screenshots and add context notes, so I can review both technical and emotional decisions later.
-

5. What to Build

P0 – MVP (Essentials)

- Fast trade entry form with instrument, prices, stop loss, quantity, direction, and timestamp
- Pre-built tags for common Indian setups (RSI Divergence, Fibonacci, Bollinger Squeeze, ADX Trend, Breakout)
- Automatic P&L, Risk-Reward, and outcome calculation
- Basic performance dashboard (win rate, total P&L, top setups)

P1 – Next Layer

- Advanced filtering by setup tag, expiry week, or market condition
- Chart screenshot attachment with annotation support
- Weekly review prompts
- F&O expiry awareness flags

P2 – Future Enhancements

- Anonymized community benchmarking
 - Broker API integration (Zerodha/Groww)
-

6. Non-Goals

This is strictly a **personal post-trade journaling and analysis tool**. It will not execute trades, provide signals, screen stocks, or offer investment advice.

7. Core Design Decision

The main tension was choosing between fully structured fields versus free-form notes.

Resolution: Hybrid model. Structured fields handle everything measurable. One open “Context & Emotion” text box at the bottom allows traders to write what they were feeling — “Exited early due to fear even though RSI still supported continuation.” Structured data powers statistics; the notes preserve the human side of trading psychology.

8. Wireframe Descriptions (Text-Based)

Trade Entry Screen: Minimalist form with quick tag buttons. Real-time P&L preview updates as fields are filled. One-tap screenshot attach.

Dashboard Screen: Overview cards for key metrics + filterable recent trades. Top-performing setups highlighted.

Review Screen: Split layout for Sunday review sessions. The left side shows structured data — setup tag, R:R ratio, P&L, outcome, and market condition. The right side displays the attached chart screenshot alongside the trader’s emotional/context notes. During weekly review, the trader can quickly scan patterns, compare similar setups, and write one overall reflection for the week. This side-by-side view makes it easy to connect technical decisions with emotional state.

9. Technical Requirements

Primarily client-side for speed and privacy. Local storage for offline journaling. Optional future read-only broker API access. Strong disclaimers positioning it as a personal tool only.

10. Risks and Mitigations

Risk	Description	Mitigation
Manual Entry Fatigue	Traders abandon if logging takes too long	Strict focus on sub-3-minute entry flow
Inaccurate Data	Wrong entries distort analysis	Easy edit history + confirmation prompts
Regulatory Risk	Perceived as investment advice	Clear disclaimers + journaling-only scope
Emotional Bias	Traders avoid logging losing trades	Weekly review prompts that normalize losses

11. Rollout Plan

Phase 1: Build and use personally for 30–45 days to validate workflow.

Phase 2: Share prototype with 8–10 active traders from communities.

Phase 3: Iterate based on real usage data before wider release.

12. Key Learnings & Retrospective

The biggest lesson from my own trading is that discipline beats technical skill in the long run. I often know the right setup but fail due to fear or greed. A good journal forces me to confront those moments systematically. If I were building this again, I would prioritize the emotional context field even more — because that's where most of the real learning happens.
